Electronics factory inspection battery panel real picture

Frequently Asked Questions

What is a typical battery inspection setup?

Typical battery inspection setup showing a “stacked” type cell with alternating Anode/Cathode (blue & red) layers with polymer separator (green) between each interface. Incident SWIR radiation illuminates the sample and the light reflected back to the SWIR image sensor provides detail regarding the subsurface layers covered by the separator.

Do X-rays show a damaged battery?

X-rays may show surface damage or cracks in the battery that may indicate improper handling or shipping damage. X-ray inspection and CT scans provide a non-invasive, rapid, and detailed examination of the internal structure and material distribution of batteries.

Can SWIR battery inspection improve Legacy solutions?

Edge Detection: One area where SWIR battery inspection promises to improve upon legacy solutions, is battery capacity. Battery capacity is proportional to the amount of overlapping electrode area achieved during assembly.

How do porous structures affect battery performance?

Porous structures can affect battery performance by impeding electron and ion flow. X-ray images or CT scans can show the thickness and homogeneity of individual layers in the battery. Deviations from the desired values may indicate production defects. CT scans can reveal anode overhangs or other misalignments between anodes and cathodes.

How do X rays show a battery?

X-ray images or CT scans can show whether the materials in the battery are evenly distributed. Irregular distributions can indicate manufacturing defects that can affect battery performance. X-rays can detect air bubbles or air pockets within the battery.

What are battery manufacturers' quality control requirements?

Battery manufacturers' quality control requirements vary widely and can be broadly divided into three categories: Manufacturers who produce lower volumes or have low-quality requirements for their products only need manual systems for small batches or single inspections. These are often high-resolution laboratory CT systems.
